

Executive Sales Dashboard: Company Performance at a Glance

A two-page executive reporting suite (Company Performance and Sales Performance, YTD 2026) covering \$8M in revenue, segment and regional breakdowns, sales-rep leaderboards — and a QA pass that caught real issues before this reached a C-suite audience.

Scope: YTD 2026

Role: Data Analyst

5 regions · 3 segments · 20 customers

Original model & theme design

01 · Overview

\$8M in revenue, and a report that's still being tightened

This is a two-page executive sales suite: a daily Company Performance view (\$8M revenue, \$4M gross profit, 46.7% margin, 94.1% target attainment) and a YTD Sales Performance view (rep leaderboard, customer segments, revenue trend). Enterprise customers drive the business — 62% of total revenue at roughly 3x the average order value of SMB accounts — with the West and Northeast regions leading growth, and Q4 seasonality historically boosting revenue by about 18%.

Building and validating this report also surfaced real issues worth documenting — the kind of QA pass that matters just as much as the analysis itself before a report reaches an executive audience.

WHAT SURPRISED ME

The dynamically-generated insight text doesn't always match its own visuals. Page 2's insight line names "Chloe Anderson" as the leaderboard leader, but the chart itself shows Marcus Johnson with the longest bar (~\$3M) — the highest revenue of any rep shown. The same page's Revenue YTD and Profit YTD cards display "(Blank)," and Revenue YoY % shows 0.0%, despite the insight text separately claiming "+18.3% YoY growth."

Key takeaway: An automated insight sentence is still a claim that needs to match the numbers next to it — a report can have perfectly correct visuals and still mislead a reader through the narrative text layered on top.

02 · Approach

The analyst workflow behind this report

This project follows a standard data-analyst pipeline end to end:

1. Ingest — order-level transaction data (customers, products, sales reps, and dates) for YTD 2026.

2. Power Query — *[transformation steps to follow]*.

3. Star schema & relationships — a clean star schema: **FactOrders** connects to **DimCustomer**, **DimProduct**, **DimCalendar**, and **DimSalesRep**, all active many-to-one relationships. Full diagram in Section 03.

4. DAX measures — *[measure list to follow]*.

5. Data dimensions — **DimCalendar** (MonthName, MonthNum, Quarter) drives every trend view — though as flagged above, the month sort currently isn't wired to MonthNum. See Section 04.

6. Analysis & visualization — two report pages — Company Performance and Sales Performance — covered in Section 04.

7. Reporting — this document.

The semantic model and this report's design system were designed and built by me as part of this analysis — not a default template.

03 · Data Model

Semantic model & DAX relationships

A textbook star schema: **FactOrders** (Discount, GrossProfit, OrderDate, OrderID, Qty, SalesAmount, SalesCost) connects to four dimensions — **DimCustomer** (City, CustomerName, Region, Segment, State), **DimProduct** (Category, ListPrice, ProductID, ProductName, StandardCost, SubCategory), **DimCalendar** (Date, DayOfWeek, IsWeekend, MonthName, MonthNum, Quarter), and **DimSalesRep** (AnnualQuota, Manager, Region, RepName) — all active, all many-to-one. Two additional tables carry no relationships by design: **Sales Measures**, a dedicated home for the model's DAX measures (Attainment %, Avg Monthly Rev, Avg Order Value, Customer Count, Forecast 3 Months, Last Refresh, Margin %, Orders), and **LastRefresh**, a single-column utility table holding the report's refresh timestamp.

Semantic model — FactOrders at the center of a clean four-dimension star schema; Sales Measures and LastRefresh are intentionally unconnected utility tables.

Manage relationships

New relationshipAutodetect

EditDeleteFilter

☐	From: table (column) ↑	Relationship	To: table (column)	Status	
☐	FactOrders (CustomerID)	* ← 1	DimCustomer (CustomerID)	Active	...
☐	FactOrders (OrderDate)	* ← 1	DimCalendar (Date)	Active	...
☐	FactOrders (ProductID)	* ← 1	DimProduct (ProductID)	Active	...
☐	FactOrders (SalesRepID)	* ← 1	DimSalesRep (SalesRepID)	Active	...

Manage Relationships view — exactly four active relationships, confirming the clean star-schema structure.

PENDING

Power Query transformation steps and DAX measures will be added here once provided, following the same step-by-step and measure-card format as the other case studies.

04 · Insights

Two pages: what's working, and what needs a fix

COMPANY PERFORMANCE: THE DAILY VIEW

\$8M revenue, \$4M gross profit, 46.7% margin, and 94.1% target attainment. The Northeast region leads on both revenue and profit (roughly \$3.8M), while the Southeast trails every other region (roughly \$1.2M). Conference Table 8-Seat and Credenza Cabinet are the two clear top-revenue products. Jupiter Consulting is the single highest-revenue customer (\$873,219), and across the top-customer list, Enterprise accounts make up the clear majority — total revenue across the tracked customers reaches \$8,112,852 with \$3,789,373 profit at 46.7% margin over 945 orders.

SALES PERFORMANCE: THE REP VIEW, AND WHERE IT BREAKS

The West region is called out as the revenue leader in the insight text, and Enterprise clearly dominates the customer-segment donut against Mid-Market and SMB. But this page is also where the data-quality issues live: Revenue YTD and Profit YTD both display "(Blank)," Revenue YoY % shows 0.0% even though the insight text separately claims +18.3%, and the leaderboard chart's actual top performer (Marcus Johnson, ~\$3M) doesn't match the insight text's claim ("Chloe Anderson tops the leaderboard").

DATA QUALITY & QA FINDINGS

Issue	Where	What it looks like
Month sort is alphabetical, not chronological	Both trend charts (pages 1 & 2)	X-axis reads Apr, Apr, Aug, Dec, Feb, Feb, Jan, Jan, Jul... instead of Jan→Dec — <code>MonthName</code> needs "Sort by Column" set to <code>MonthNum</code> , which already exists in <code>DimCalendar</code> .
Blank/zero KPIs on page 2	Sales Performance page	Revenue YTD and Profit YTD show "(Blank)," Revenue YoY % shows 0.0% — likely a filter-context or relationship issue specific to that page's visuals.
Insight text contradicts its own chart	Sales Performance page	Text names Chloe Anderson as leaderboard leader; the chart shows Marcus Johnson with the longest bar.

None of these are catastrophic on their own, but stacked together on one page headed to an executive audience, they're exactly the kind of thing a QA pass exists to catch before distribution.

05 · Recommendations

The transferable takeaway

- **Fix the month sort first** — it's a one-click change (Sort by Column, `MonthName` → `MonthNum`, which already exists in the model), and it's currently making every trend chart unreadable.
- **Investigate the blank/zero KPIs on page 2 before this report ships** — Revenue YTD, Profit YTD, and Revenue YoY % all returning blank or zero on one specific page, while working correctly elsewhere, points to a page-level filter or relationship problem worth isolating.
- **Audit generated insight text against its own visuals every refresh** — the Chloe Anderson/Marcus Johnson mismatch is a trust problem, not just a display bug; a wrong narrative claim next to a correct chart is worse for an executive reader than no narrative at all.
- **Build a segment-specific strategy around Enterprise's outsized value** — 62% of revenue at 3x the average order value of SMB justifies different sales motions per segment, not one blended approach.
- **Treat Southeast as a triage decision, not background noise** — it's the lowest-performing region on both revenue and profit; worth a deliberate decision to invest or deprioritize, rather than letting it sit unaddressed.
